Session 7 and 8 summary

AI Challenge · Sessions 7 & 8 Summary

Agentic coding, project memory, skills, MCP tools, and structured AI-assisted product development

1 WHY THESE SESSIONS MATTER

From chatbot to builder
Students moved from simple prompting to AI-assisted product building with files, folders, tools, and reusable workflows.

Structure before code
Good products begin with planning, requirements, and design before development.

Context controls output
Memory files, boundaries, banned words, and verification rules shape what the AI produces.

2 SESSION FOCUS · AGENTIC CODING & IDEs

A. AI coding IDE
Codex was used as the working environment; Claude Code and Google Antigravity were referenced as similar tools.

B. Different from chat
In chat, work happens in the cloud; in an IDE, AI works on a local project folder.

C. Local project folder
The computer folder becomes the source of truth for code, assets, and memory files.

D. Tool switching
Good file structure makes it easier to move between tools and synchronize with GitHub.

3 THE DEVELOPMENT SEQUENCE

PlanDesignBuildTestGuardrailIterateDeploy

AI multiplies input quality: weak planning creates weak code; strong planning creates stronger products.

4 ARCHITECTURE REMINDER

Frontend — the visible interface.

Backend — the logic and integrations.

Database — the storage layer.

! Ticketing-app lesson: polished AI code can still fail under load if the database is not protected correctly.

5 THE THREE CORE PROJECT FILES

1. agents.md
Project memory: company idea, audience, tone, banned words, boundaries, and rules like "Interview me if information is missing."

2. PRD.md
Product Requirements Document: features, screens, user flows, tech stack, database logic, and constraints.

3. design.md
Design system: colors, typography, layout, UX principles, components, and copy tone.

i Different tools may use different names, such as CLAUDE.md, but the logic is the same: stable project context for the AI.

6 SKILLS: REUSABLE INSTRUCTIONS

PRD skill
helps generate stronger product requirements.

Copywriting skill
improves landing-page language and marketing messaging.

UI/UX skill
guides layout and interaction design.

Taste skill
pushes the AI away from generic design toward better visual judgment.

Person icon Skills are called when needed; memory is always present.

7 MCP · CONNECTING AI TO TOOLS

AI IDEMCPExternal Tool Library

- MCP means Model Context Protocol.
- It gives the AI access to external services or libraries.
- In class, students experimented with connecting to 21st.dev to access UI components and motion-rich design ideas.

Wrench icon Setup can be messy: students often needed API keys, verification, and an IDE restart.

8 LIVE LAB · WHAT STUDENTS DID

1Opened Codex and created a new local project folder.
2Created agents.md with project memory.
3Generated a first landing page from the project memory.
4Installed a PRD skill.
5Installed copywriting and design-related skills.
6Connected or attempted to connect an MCP server from 21st.dev.
7Regenerated the landing page and compared Version 1 vs Version 2.

9 OPERATING PRINCIPLES

Do not skip planning.

Use project memory.

Give boundaries.

10 BIG TAKEAWAYS

Context is the foundation
The AI builds consistently only when memory, PRD, and design instructions are solid.

Skills turn prompting into process
Reusable instructions improve quality and consistency.

Tools make agents practical
MCP and external services expand what AI can do.

Human judgment still matters
Real AI product development is orchestration, not just vibe coding.
