## session summary

# AI Challenge • Sessions 9 & 10 Summary

Deployment, circular learning memory, product documentation, Karpathy-style planning, RAG basics, and project deliverables

### 1 WHY THESE SESSIONS MATTER

**From prototype to publish**  
Students moved from building landing pages locally to putting them online.

**From prompting to process**  
AI work became more structured through memory, documents, and planning loops.

**From one-shot output to systems**  
Better AI projects rely on supervision, documentation, and iterative execution.

### 2 DEPLOYING A LANDING PAGE

Everything built in Codex lives on the local computer.

A ZIP file preserves the HTML, CSS, media, and folder structure.

Uploading the ZIP creates a live landing page.

Custom domains come later.

### 3 HUMAN SUPERVISION STILL MATTERS

- AI can hallucinate the wrong export.
- Some students asked for a ZIP and got too many files, not only the landing page.
- Lesson: always inspect what the AI packaged before publishing.

### 4 CIRCULAR LEARNING MEMORY

The goal is to let the agent improve over time instead of repeating the same mistakes.

### 5 THE THREE CORE PROJECT DOCUMENTS

**agents.md**  
the one-pager: idea, target persona, brand voice, goals, and project context.

**PRD.md**  
product requirements: features, flows, backend needs, APIs, testing, and platform considerations.

**design.md**  
the brand/design system: colors, typography, components, layout rules, and consistency guidelines.

★ These documents make projects portable across tools.

### 6 MODEL CHOICE & PORTABILITY

LLMs are increasingly a commodity: use the right model at the right time.

Google AI Studio is useful for fast experimentation without spending too many tokens.

Well-written project files let teams move between Codex, Claude, Antigravity, Lovable, and other tools.

### 7 DESIGN SYSTEMS AS A BRAND BOOK

- design.md acts like a modern AI-ready brand book.
- It helps keep color, typography, tone, and UI consistent across tools.
- This is especially useful for marketing assets, landing pages, and future builds.

### 8 KARPATHY-STYLE APP PLANNING

- One-shot generation is weaker.
- The Karpathy-style skill encourages recursive planning and execution.
- It creates a development plan, sprint tasks, success criteria, and step-by-step build stages.
- This reduces hallucinations and improves app quality.

### 9 RAG IN PLAIN ENGLISH

**WITHOUT RAG**

Expensive and inefficient.

**WITH RAG**

RAG reduces cost and keeps context focused.

### 10 LIVE LAB / STUDENT DELIVERABLE

|   |                                                                                                     |   |
|---|-----------------------------------------------------------------------------------------------------|---|
| 1 | Create a project idea for the final group project.                                                  | ✓ |
| 2 | Build the agents.md file.                                                                           | ✓ |
| 3 | Generate the PRD.md file.                                                                           | ✓ |
| 4 | Generate the design.md file.                                                                        | ✓ |
| 5 | Submit the 3 files in Blackboard.                                                                   | ✓ |
| 6 | These 3 files become the starting point for the project that students will build and present later. | ✓ |

This is different from the separate Amazon challenge.

### 11 BIG TAKEAWAYS

Publish carefully: deployment is easy, but file structure matters.

Memory improves AI: circular learning helps the agent adapt.

Documents unlock teams: good documentation makes collaboration and tool-switching easier.

Systems beat prompts: the best AI work combines planning, supervision, iteration, and the right tools.

AI Challenge • Sessions 9 & 10 • Blackboard recap
